

Application No. 10/716,623

IN THE ABSTRACT:

Please enter the following Substitute Abstract of Disclosure for that originally submitted with this application.

ABSTRACT OF THE DISCLOSURE

A structure of turning control on a wheel, and mainly consists of a pair of symmetrical outer shells., within each of which is defined a circular trough, and two arched troughs extend from each of the circular troughs. A plurality of L-shaped latches are configured on an outer surface of each of the shells. A fixing axis with symmetrical protrusions is disposed between the two outer shells, and U-shaped spring pins are respectively disposed within the circular troughs of the outer shells so that the spring pins push against the protrusions. After the shells are placed in a center of a wheel, left and right directional control of the wheel is realized through synchronous motion of the protrusions within the arched troughs, the protrusions being held in place by the spring pins.
